Accessibility Guidance

BRAND STANDARDS · RJMLAIRD.CO.UK

WCAG 2.2 AA

This guidance sets out how to use the brand's visual identity accessibly across websites, presentations, reports, PDFs, social graphics and email signatures. It preserves the existing palette — ink #0B0F1A, warm white #EDEAE3, teal #00C2A8, amber, violet, coral, green and sky — while establishing practical rules for contrast, typography and accessible content.

> **Guiding Principle**
> Accessibility is part of the design system, not a finishing touch. Brand colours and visual treatments should never make information harder to read, understand or use.

1. CONTRAST-SAFE COLOUR COMBINATIONS

WCAG 2.2 AA provides the recommended baseline:

- **Normal text:** contrast ratio of at least **4.5:1**.
- **Large text:** at least **3:1** (approximately 24 CSS px regular or 18.7 CSS px bold).
- **Meaningful graphical objects & UI components:** at least **3:1** against adjacent colours where required.
- **Non-colour cues:** Colour must not be the only way information, status or meaning is communicated.

The ratios below are calculated from the supplied core colours using the WCAG relative-luminance method. Treat the accent-colour pairings as starting points; test every actual use, including hover states, overlays and transparency.

Aa — PASS (15.93:1)

Ink on warm white

Recommended default for light layouts.

Aa — PASS (8.46:1)

Ink on teal

Recommended for teal highlights and buttons with dark text.

Aa — FAIL (1.88:1)

Teal on warm white

Do not use teal for text on warm white.

Aa — PASS (18.47:1)

Ink on white

Suitable for clean, high-contrast documents.

*Ratios calculated from the specified hexadecimal colours. AAA here refers to WCAG text contrast, not overall document conformance.

RECOMMENDED COLOUR RULES

Context / Use	Recommended Treatment
Main body text	Ink (#0B0F1A) on warm white (#EDEAE3) or white (#FFFFFF)
Dark-mode body text	Warm white (#EDEAE3) on ink (#0B0F1A)
